Lambda Function<Anonymous Function>:

1. It has no name

    Hello=lambda name

    Not def hello (name)

2. You can call it inline without defining it

    Example:

    Hello=lambda name :f " Hello {name}"

    Print (Hello("Shatha"))

    Output => Hello Shatha

3. You can use it in return data from another function

    Example:

    def myfunc(n):
            return lambda a : a * n

4. It used for single function
5. It's one single expression, not a block of code
6. Lembda type is function

    Example:

    Print(type(Hello))

    Output => <Class 'Function'>
